

ACHTUNG

1. Vor Inbetriebnahme des Schmalheftkopfes, bzw. vor Arbeiten an der Maschine unbedingt Hohner-Bedienungsanleitung durchlesen und alle Warnungen an der Maschine beachten.
Nichtbeachten dieser Vorschrift kann zu schweren Verletzungen führen.
2. Maschine nicht bedienen, bevor alle Schutzvorrichtungen, Verschlüsse und andere Sicherheitsvorrichtungen funktionieren, bzw. angebracht sind.
3. Vor Reparaturen und Montagearbeiten stets Stromzufuhr unterbrechen und Sicherheitsschalter (Hauptschalter) auf 0 stellen.

Der Verwender ist dafür verantwortlich, daß die Maschine zu jeder Zeit sicher arbeitet und die Bedienungsperson sich an den Vorschriften in dieser Bedienungsanleitung orientiert. Bei allen, die sichere Bedienung der Maschine betreffenden Fragen, wenden Sie sich bitte an Ihren Vorgesetzten, die nächste Hohner-Vertretung oder direkt an Hohner Maschinenbau GmbH.

Chapter I: General and services

① Technical data

a) standard stitching

The min. distance between staples depends on the stitching thickness:

0-1 mm = 48 mm
2 mm = 49 mm
3 mm = 50 mm
4 mm = 52 mm
5 mm = 54 mm

Crown width: 14 mm

Execution for the following sorts of wire:

round stitching wire no. 24-28 (0,60 - 0,40 mm dia.)
round stitching wire no. 26-30 (0,50 - 0,35 mm dia.)

Please only use name brand steel, in normal or extra high tension steel versions, depending on usage. By heavy scuffing of wire, scuff resistibility causes wire tubes to clog. Use of ligure wire is not recommended.

Net weight: approx. 3,2 kgs

b) loop stitching

The min. distance between staples depends on the stitching thickness:

0-1 mm = 50 mm
2 mm = 52 mm
3 mm = 54 mm

Crown width: 14 mm

Execution for the following sort of wire:

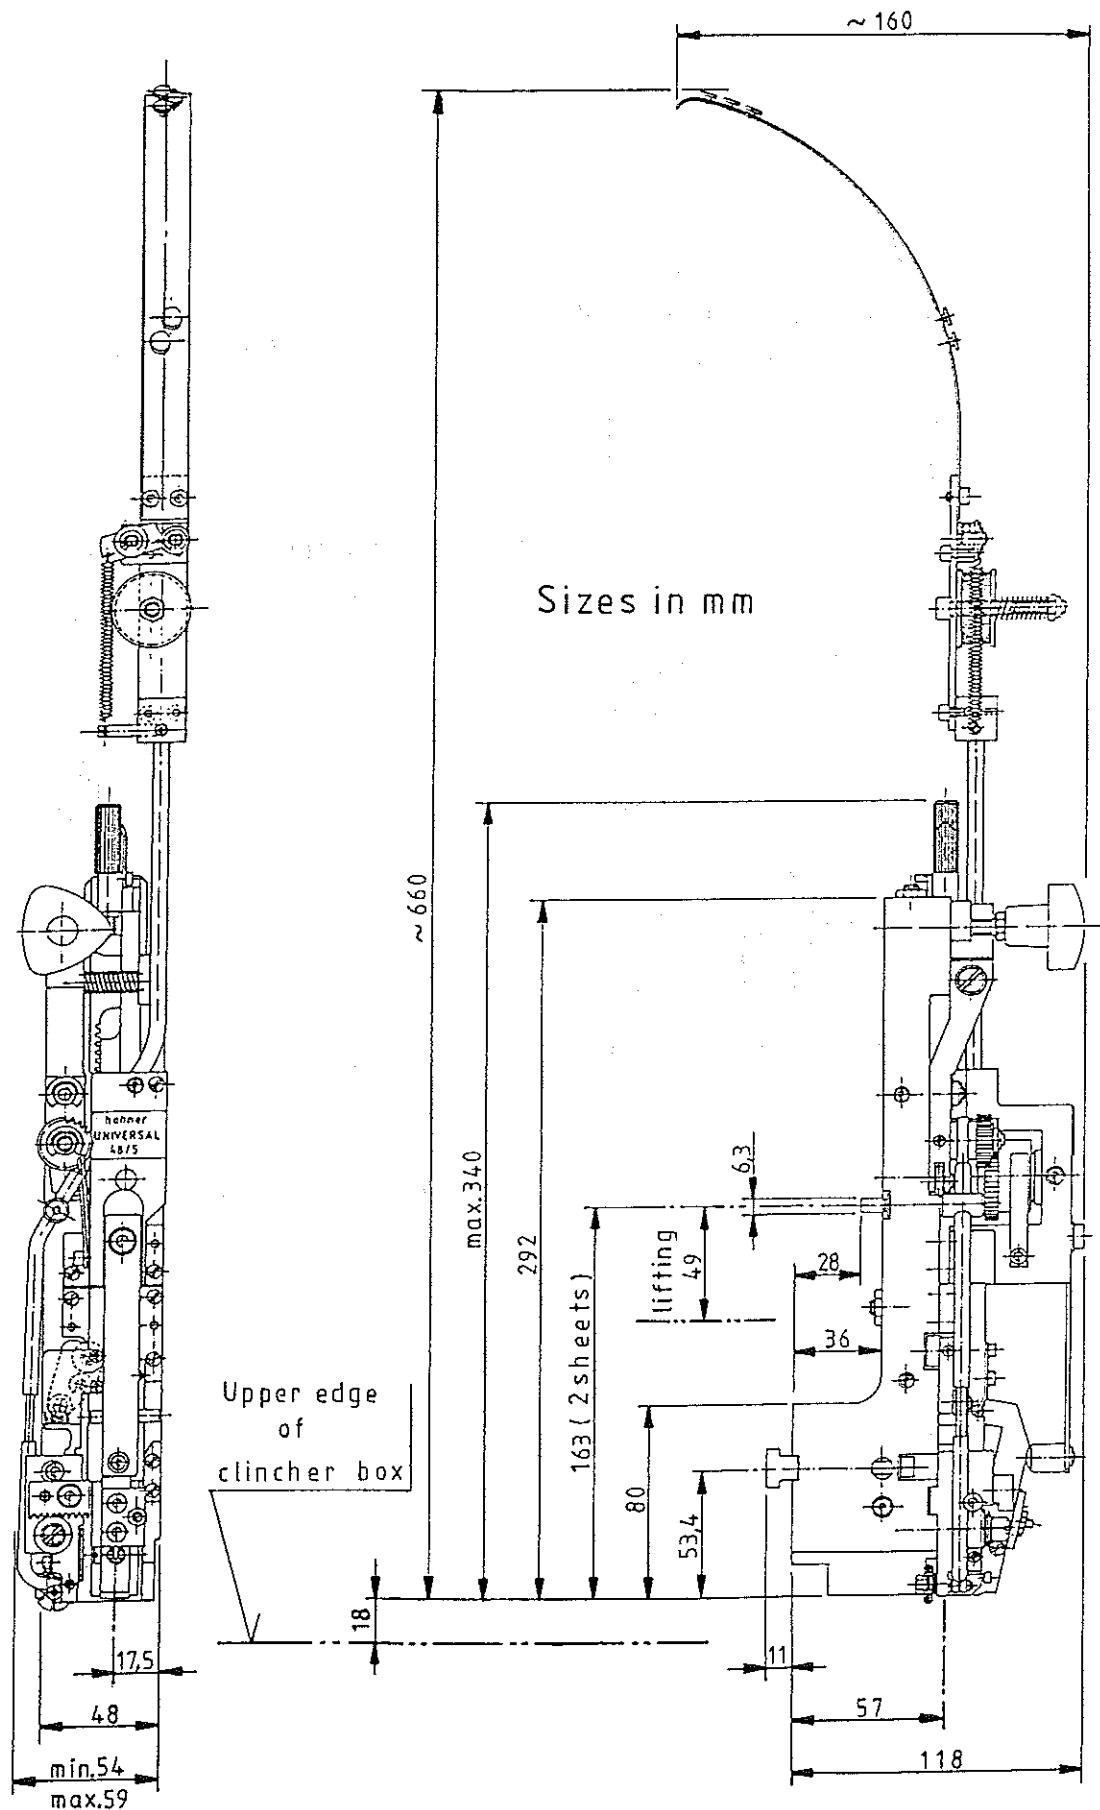

round stitching wire no. 24-28 (0,60 - 0,40 mm dia.)

Please only use name brand steel, in normal or extra high tension steel versions, depending on usage. By heavy scuffing of wire, scuff resistibility causes wire guides to clog.

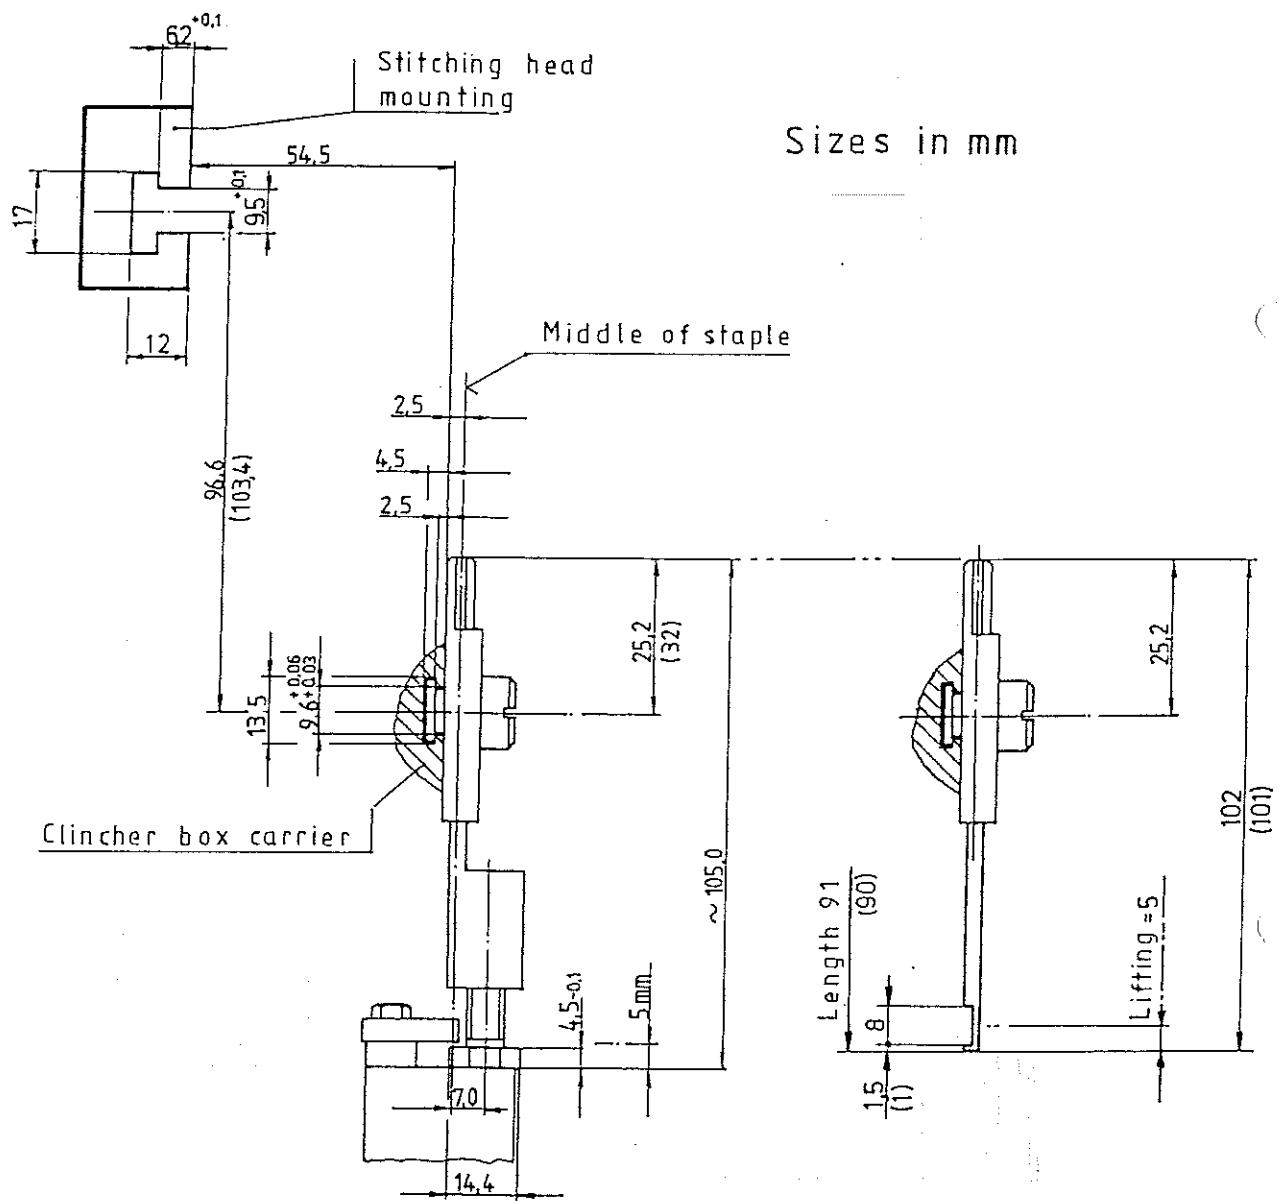

Net weight: approx. 3,2 kg

2a

Foundation plan of the Universal 48 / 5

(2b) Foundation plan of the clincher box
and stitching head mounting

(3) Supply schedule

Every new UNIVERSAL 48/5 is supplied with:

Equipment:

1 wire feeding spring

1 clincher box cpl. with clinchers and clincher pusher

Tools:

1 allen key SW 2	Art.-No.: 4600006
1 allen key SW 2,5	4600007
1 allen key SW 6	4600010
1 allen key - T-grip SW 4	4600024
1 adjusting lever	9465205

(4) Lube specification

Apply a first-rate oil only, never a viscous mineral oil, spray lubricants, nor a light oil for sewing machine. 30 W - 50 W recommended. For the one way bearing, Kluber NBU-15 must be used (available through your Hohner-dealer).

We recommend:

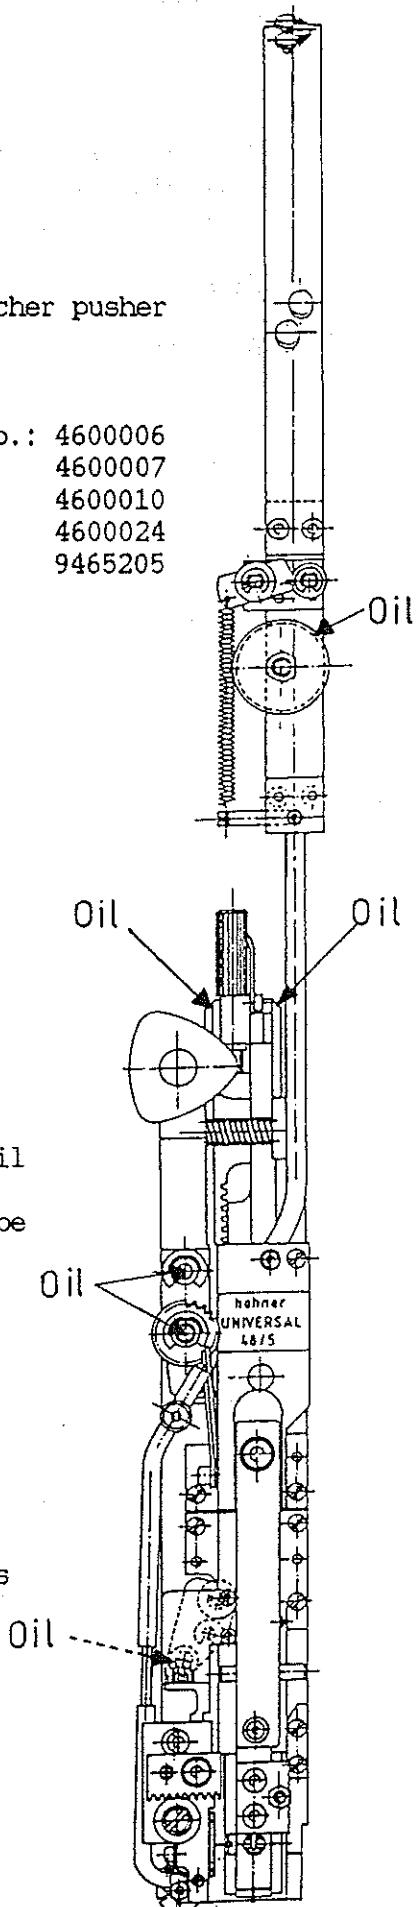

Sliding oil with viscosity grade 65-70
(ISO-viscosity grade according to DIN 51519)

Oiling: how often?

In case of need (approx. every 16 working hours)

From time to time slightly oil the felt disks on the wire feeding spring.

Please observe all these regulations carefully to guarantee a faultless operation.

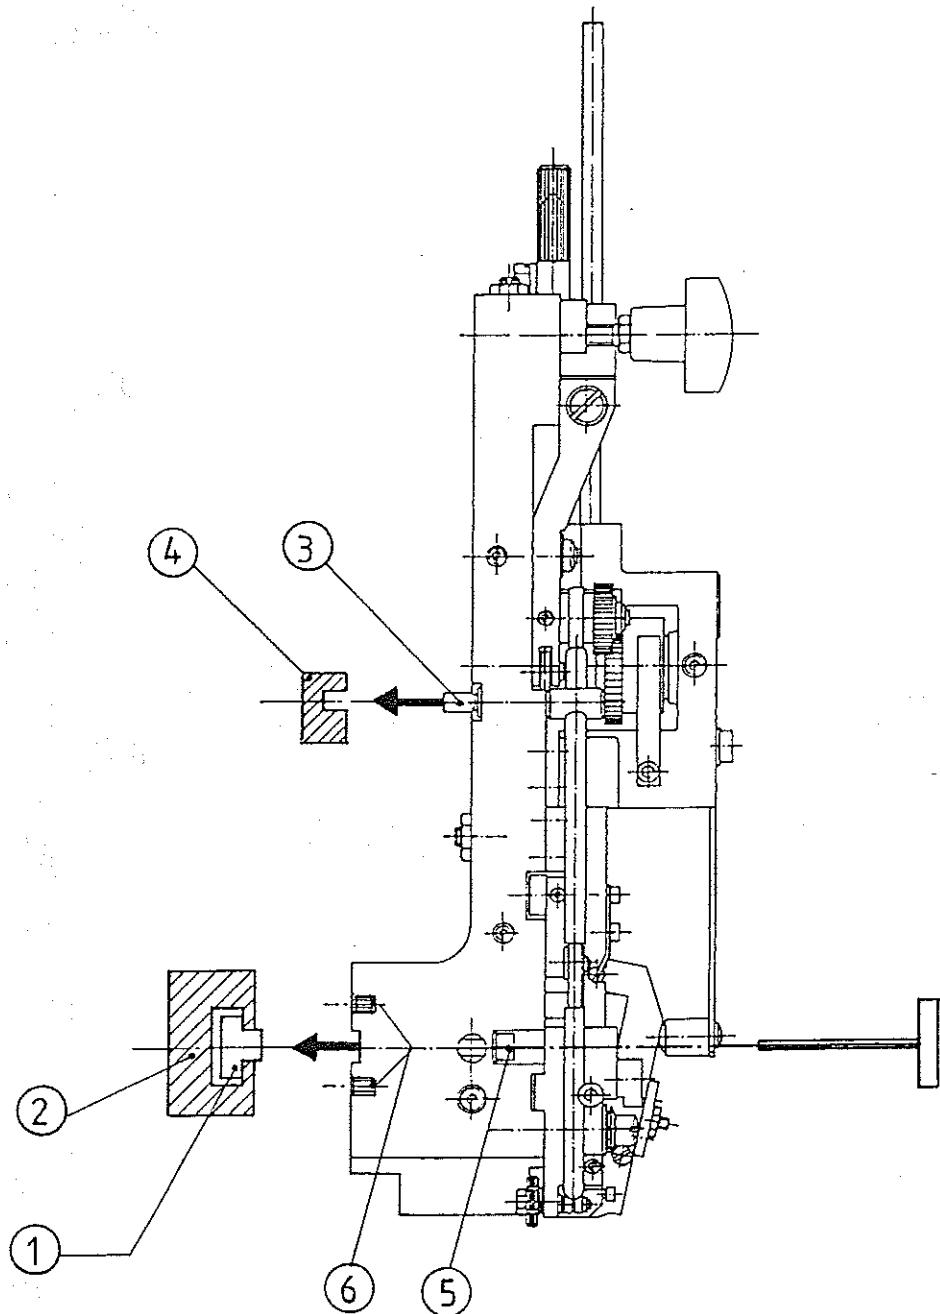

⑤ Installation and adjustment of the Univ. 48/5

Insert mounting block ① into mounting channel ② laterally. Insert the stitching head over the protruding journal of the mounting block ①, taking caution that the nose of the carrier ② properly seats in the groove of the main drive bar ④.

Tighten allen cap screw ⑤ with the delivered allen key - T-grip SW 4.

By loosing allen set screw ⑥ the stitching head can be adjusted to the clincher box.

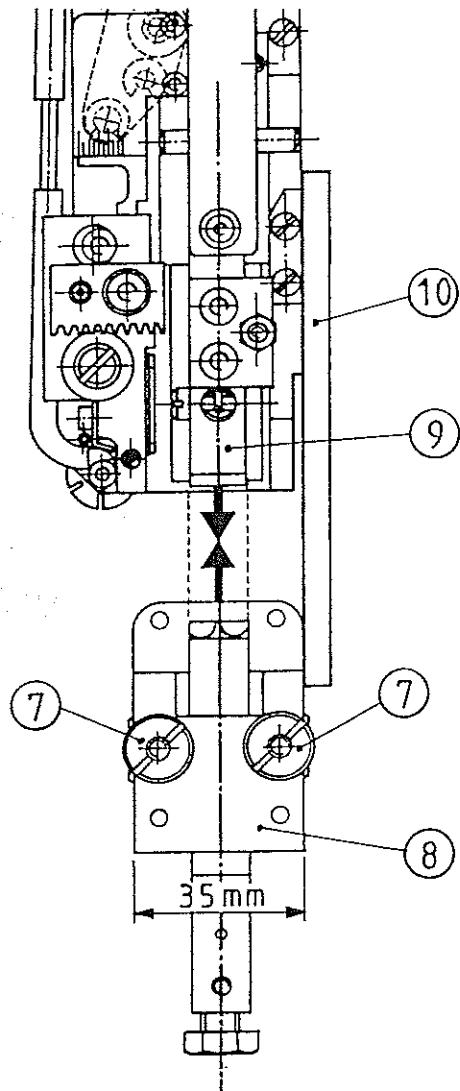

⑥ Fine adjustment of the clincher box

Loosen clamping screws ⑦. Adjust the clincher box ⑧ by moving it laterally until it is centered with the driver.

The middle of the former ⑨ must be exactly in alignment with the middle of the clincher box ⑧.

It is helpful to use a straight flat material (i. e. a ruler). The flat material ⑩ is put against the right side of the UNIVERSAL 48/5. Then, move the clincher box ⑧ (35 mm wide) to the right side against the flat material ⑩ until it stops. Tighten the clamping screws ⑦.

⑦ Inserting the wire

Turn off the wire transport (Turn orange knob ⑪ to the right).

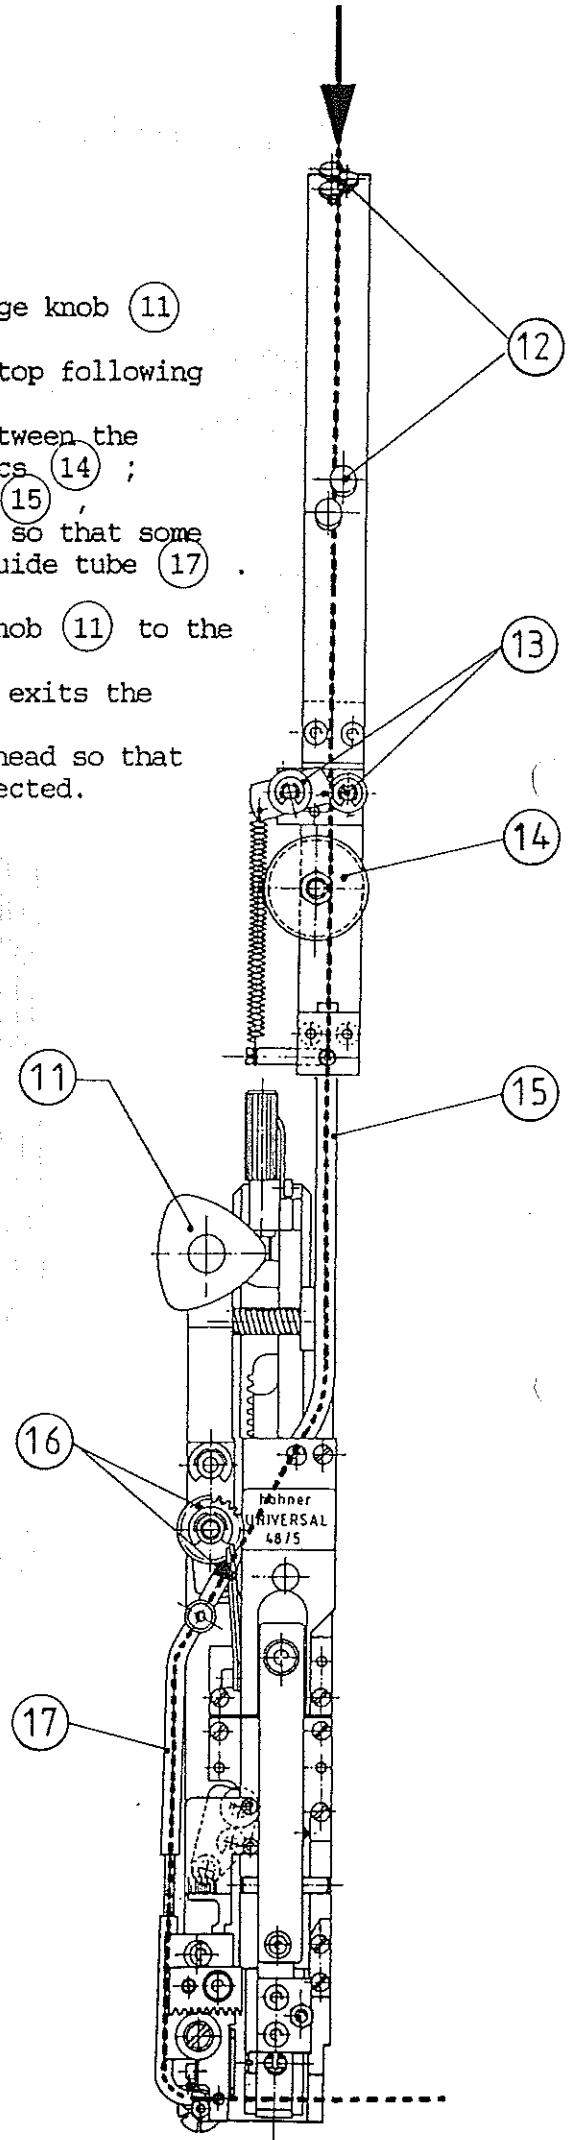

Push stitching wire through from the top following these steps:

Thread wire through eyelets ⑫, between the wire discs ⑬ and the both felt discs ⑭; then through the top wire guide tube ⑮, between both transporting wheels ⑯ so that some wire is inserted in the middle wire guide tube ⑰. Remove the former.

Turn on wire transport (Turn orange knob ⑪ to the left).

Let the unit run until the first wire exits the cutting box.

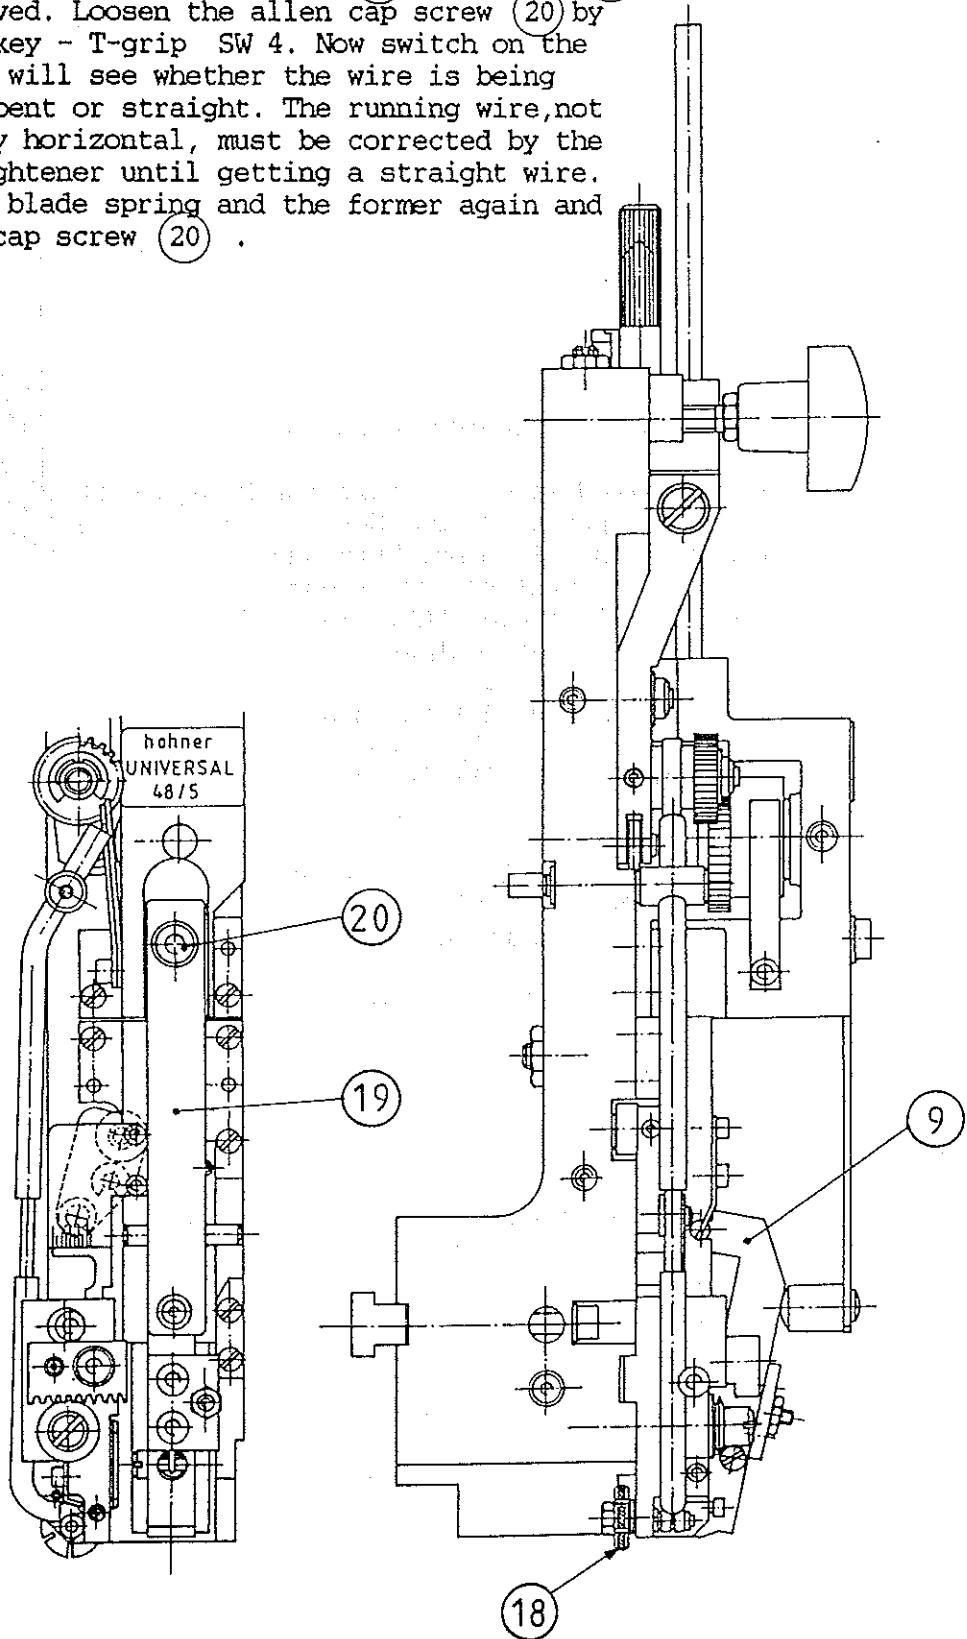

Place some paper under the stitching head so that wire segments and staples can be collected.

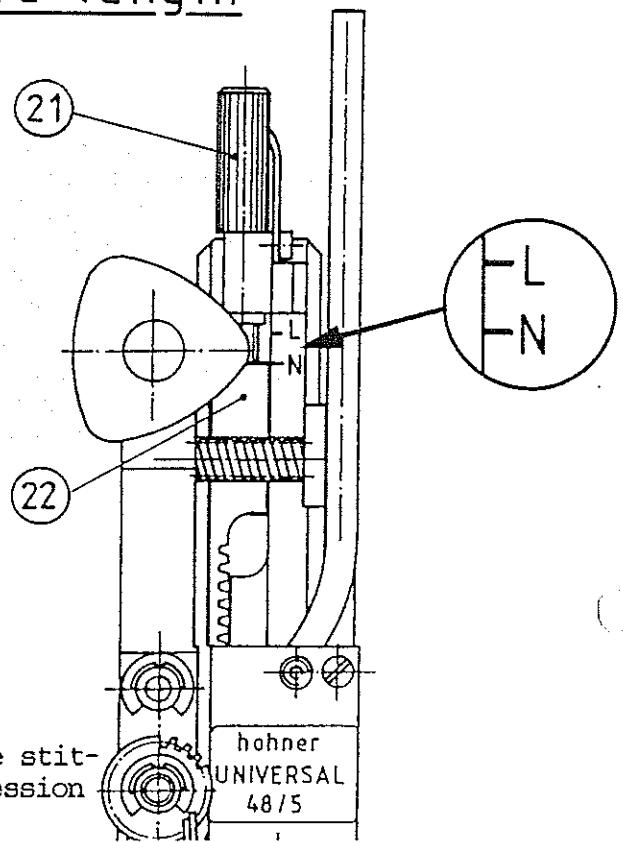

⑧

Straightening of the wire

The wire must be straight for stitching. If it is not straight or if any difficulties appear, try to change the course of the wire by slightly turning the knurled nut ⑯ by using an allen key. If this is unsuccessful blade spring ⑰ and former ⑲ must be removed. Loosen the allen cap screw ⑳ by using allen key - T-grip SW 4. Now switch on the unit and you will see whether the wire is being transported bent or straight. The running wire, not being exactly horizontal, must be corrected by the roller-straightener until getting a straight wire. Assemble the blade spring and the former again and tighten the cap screw ⑳.

⑨ Basic setting of wire length

a) standard stitching

The required length of wire for 2-page stitching is approx. 26 mm. Set the compression for 2-pages stitching. Turn adjusting screw (21) until the upper edge of the gear rack (22) indicates "N". Finer adjustment are then attained as follows:

Adjusting screw (21) is turned to the right
= longer wire

Adjusting screw (21) is turned to the left
= shorter wire

This adjustment is necessary only once, and that is when the stitching head is installed and compression is set.

Caution!

A slight correction may be necessary when heavier gauge wire is intended for use.

b) for loop stitching

The required length of wire for 2-page stitching is approx. 32 mm. Set the stitching unit for 2-page stitching. Turn adjusting screw (21) until the upper edge of the gear rack (22) indicates "L". Finer adjustments are then attained as follows:

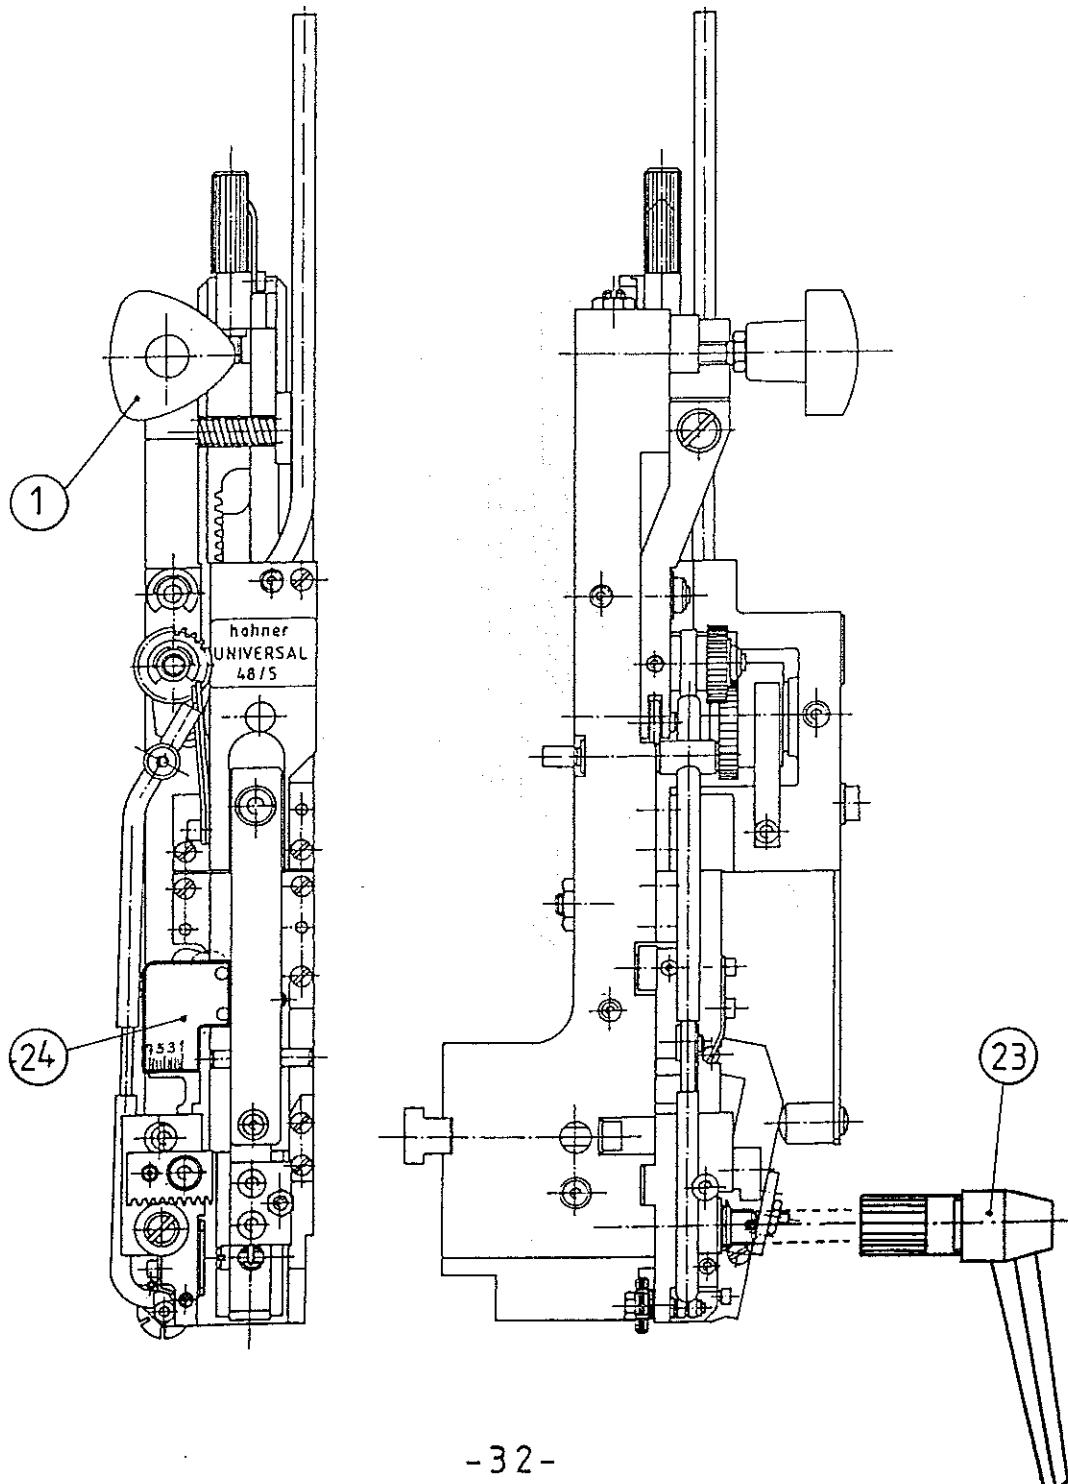

Adjusting screw (21) is turned to the right
= longer wire

Adjusting screw (21) is turned to the left
= shorter wire

This adjustment is necessary only once, and that is when the stitching head is installed and compression is set.

⑩ Setting of leg length

Upon completion of overall wire length setting, the individual clinched legs must be set so they are of equal length. Turn off the wire transport ①. With adjusting lever ②3 rotate clockwise = lengthens the right leg/shortens left, rotate counter clockwise = lengthens the left leg/shortens right. With this adjustment you are merely centering the wire in the former. An equal length of wire showing on both sides of the former is desired.

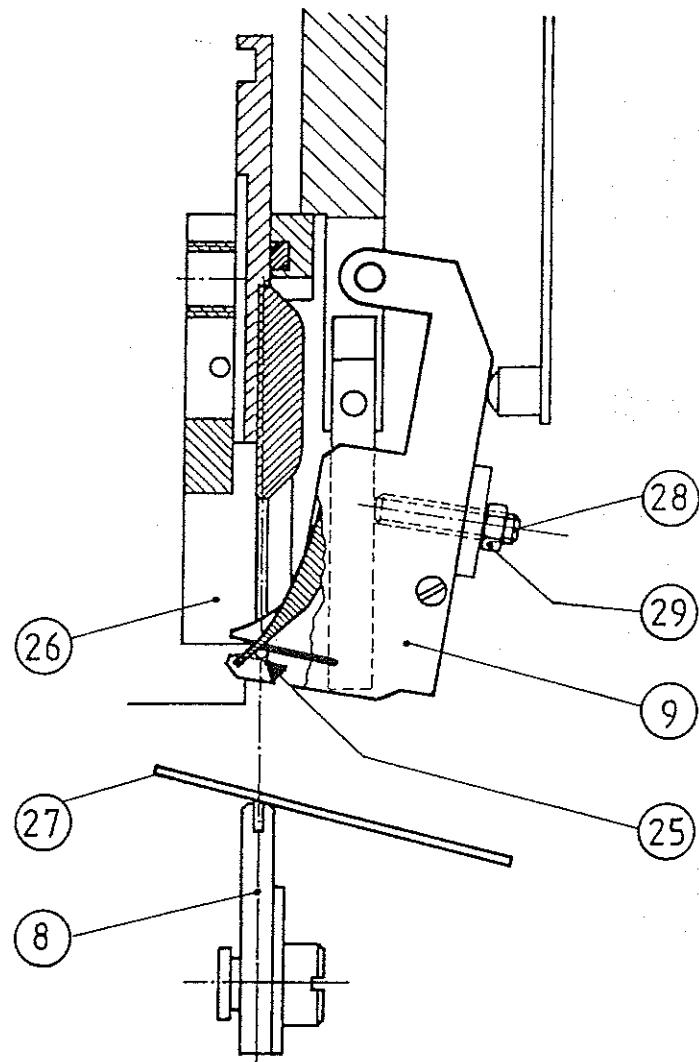

(11) Alignment of former

The stitching will be correct only when the former (9) swings in so far that the stitching wire (25) comes exactly under the middle of the groove of the bender (26). This can be controlled exactly by laying a mirror (27) on the clincher box (8), by that means the position of the former respecting the wire can be seen clearly. A correction eventually necessary can be obtained by adjusting the adjusting screw (28).

Important!

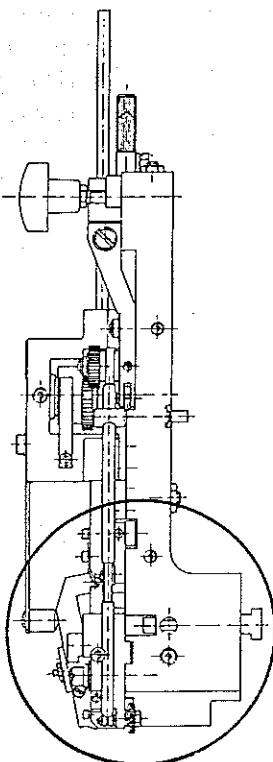

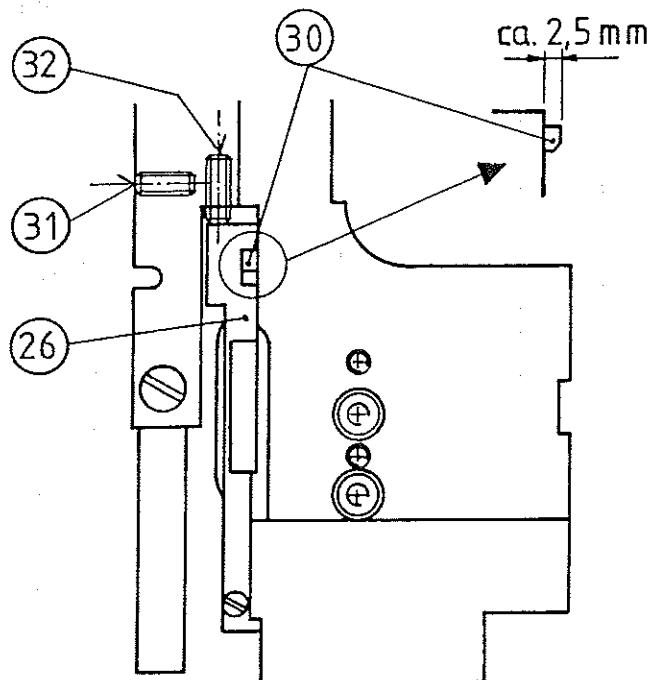

After adjustment tighten nut (29) again carefully.

(12) Alignment of bender

Before checking this adjustment, your machine must be set for the minimum book thickness (0 compression). To maintain a proper function, the stitching head must be adjusted to the stroke of your machine which is roughly done at our factory. A correction is only then necessary, if the divert blade (30) in the bender (26) does not come out

laterally 2,5 mm when the head is at its highest position. If an adjustment is necessary, place the stitching unit to the lowest position and remove the former. Loosen hex-socket screw (31) and unscrew the adjusting screw (32) 1 - 2 turns. After adjustment tighten hex-socket screw again. Now switch on the unit and examine if the divert blade come out enough. Repeat this procedure until the function is correct. The divert blade (latch) should pop out slightly prior to top dead center.

(13) Exchange of knives

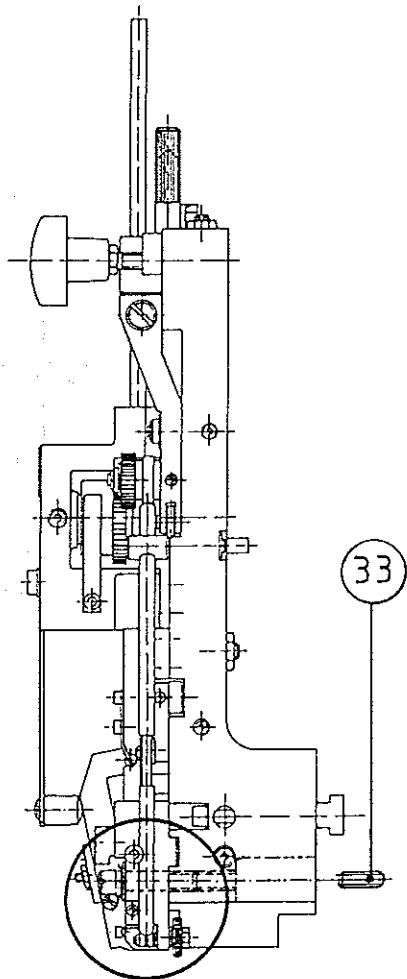

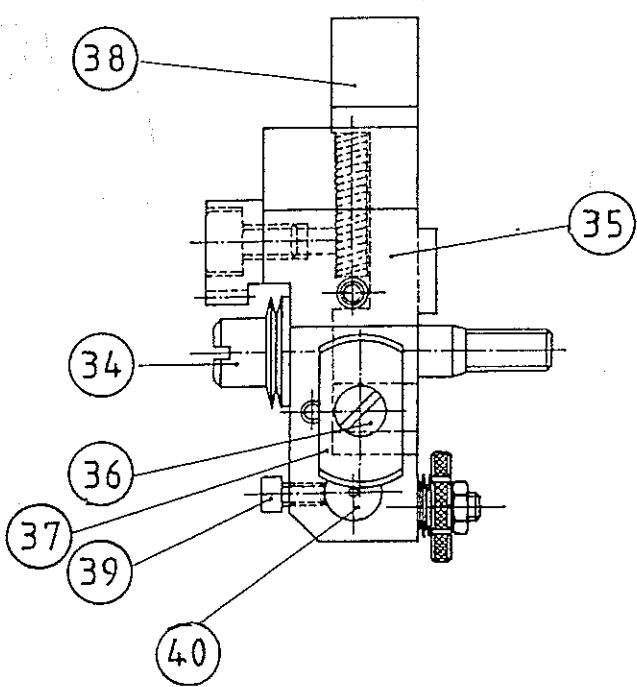

The quality of the stitching mainly depends on the condition of the knives. The knives can be used several times by turning them some degrees.

a) exchange of flat knife

Loosen flat head screw (33), remove stand-up bolt (34) and remove the cutting box (35). Loosen the flat head screw (36) at the flat knife (37) and exchange the blade. Assemble in reversed order and make sure that the stand-up bolt (34) is tightened so strongly that the cutting box (35) can only be slightly adjusted when using the adjusting lever (see chapter 10).

b) exchange of round knife

Loosen flat head screw (33). Remove stand-up bolt (34) and remove cutting box (35). Carefully remove cutting pusher (38) (the installed compression spring is under pressure). Loosen allen cap screw (39) and squeeze out round knife (40) from the left. Exchange round knife. Assemble in reversed order. When assembling the new round knife you must pay attention that the round knife (40) projects so far that an absolute cutting effect with the counter cutting edge results. For best results push in the new round knife and adjust it at the flat knife (37) pressed down. Tighten allen cap screw (39) again. Make sure that the stand-up bolt (34) is tightened so strongly that the cutting box (35) can only be slightly adjusted when using the adjusting lever (see chapter 10).

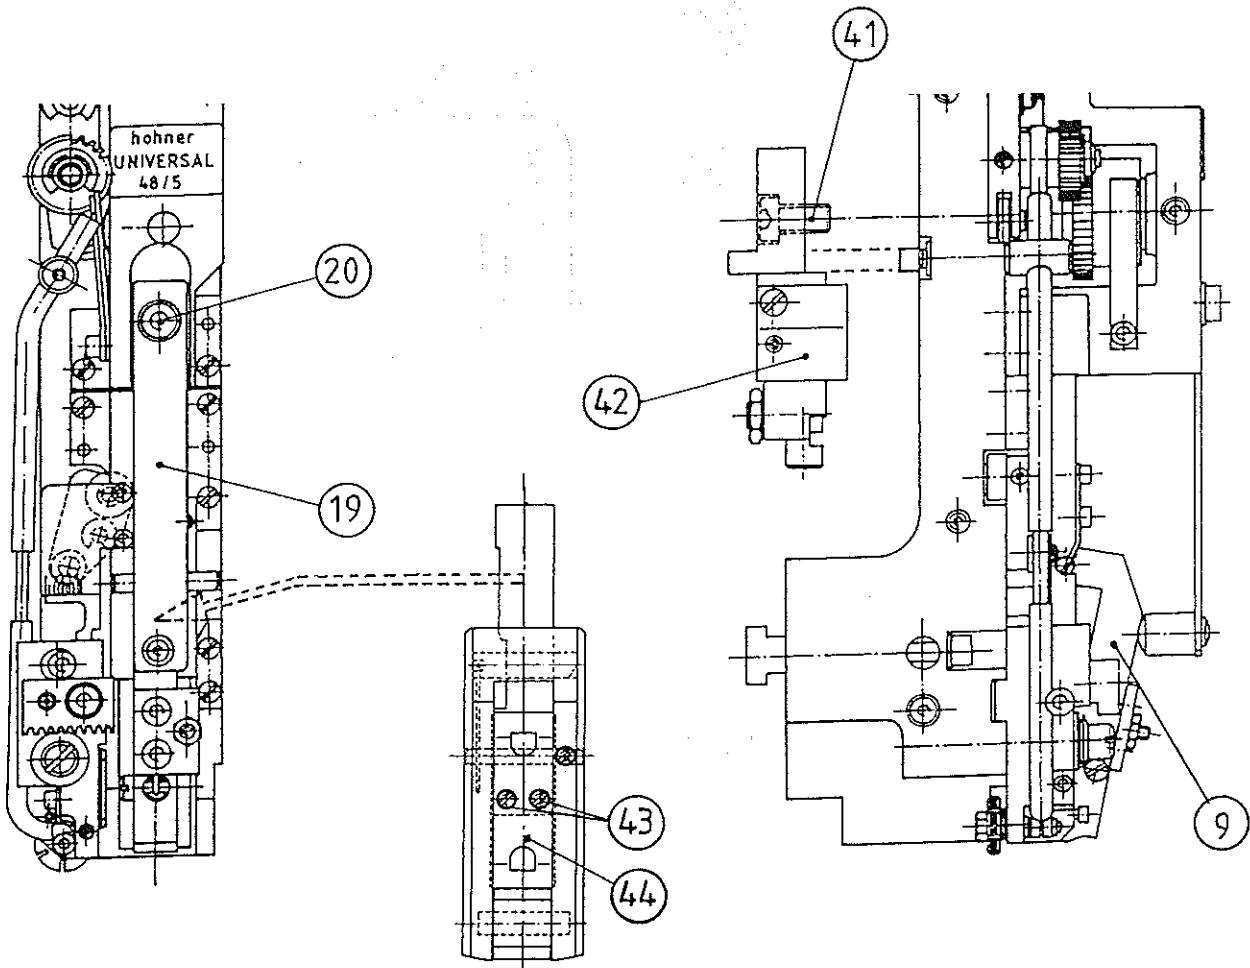

14 Exchange of bender

Loosen allen cap screw 20. Remove blade spring 19 and former 9. Remove allen cap screw 41 and the corresponding carrier 42. Pull out bender downwards. Assemble in reversed order. When inserting the bender into the stitching head, the divert blade must be pressed a bit into the bender (see chapter 12 - pos. 30).

15 Exchange of driver

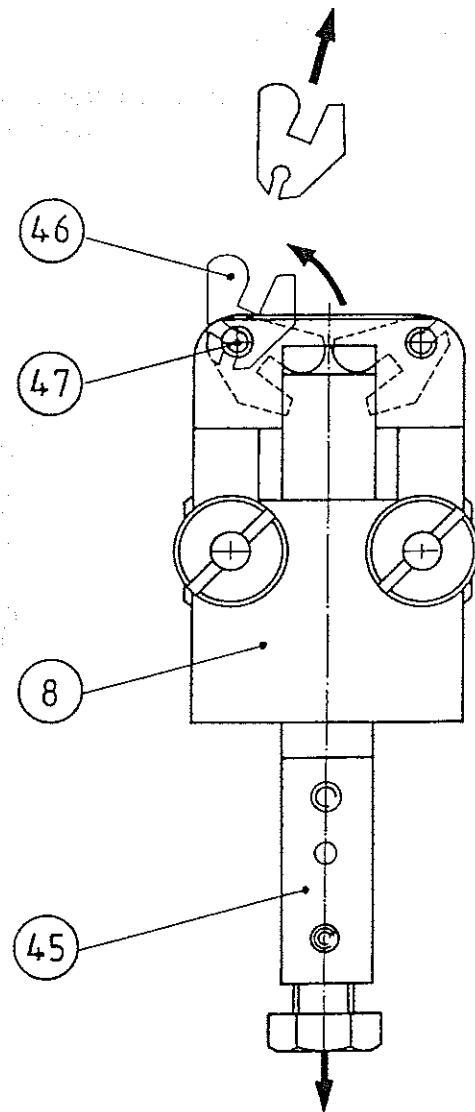

Loosen allen cap screw 20. Remove blade spring 19 and former 9. Turn out the two studs 423 in the driver 44 and pull out of the bender downwards. Assemble in reversed order.

If the lower edge of the driver is worn out, the driver can be turned round and used again.

⑯ Exchange of clinchers

Draw out clincher pusher ④5 downwards. Turn clinchers ④6 in the clincher box ⑧ upwards and extract them out of the locking bolt ④7.
Push in new clinchers into the locking bolt ④7, turn them around to the middle of the clincher box. Insert the clincher pusher again.

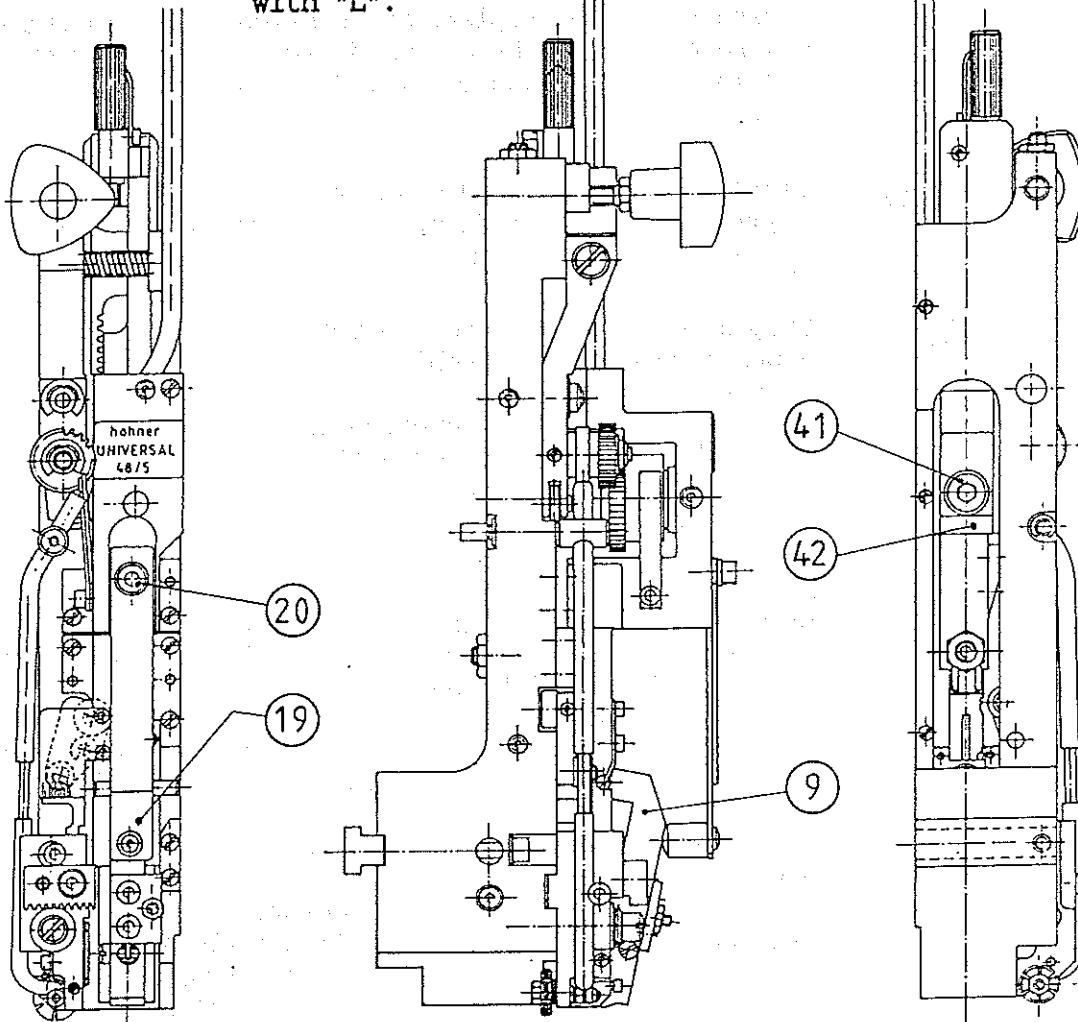

Chapter II: conversion of the Universal 48/5 to loop stitching.

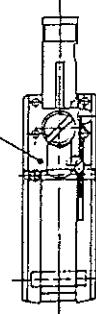

For loop stitching, a change part set consisting of the following parts is needed:

3863418 blade spring, short
9961352 bender, complete
9963410 former, complete

All parts needed for loop stitching are marked with "L".

Exchange of the loop stitching parts:
Loosen allen cap screw 20. Remove blade spring 19 and former 9. Remove allen cap screw 41 and the corresponding driver 42. Pull out bender 26 downwards. Insert bender for loop stitching into the stitching head and make sure that divert blade is pressed a bit into the bender (see chapter 12 - post. 30). Install driver 42 and tighten allen cap screw 41. Install former for loop stitching. Put blade spring, short for loop stitching on long blade spring 19 and fasten with allen cap screw 20. Before operating, please carefully study chapter 11 and 12. Set wire length indicator at "L".

Chapter III : Troubleshooting

Here are some examples of faults with specifications of the possible causes. There are often different reasons which have to be investigated step by step. Do not apply all suggestions simultaneously but one after the other making tests in between.

Worn out parts should be exchanged.

Staple back arched:

- wire weak or soft
- wire not straightened: see chapter 8
- round or flat knife worn out: see chapter 13
- pressure of the shoe tongue weak or blocked: remove blocking wire pieces or replace compression spring in the shoe tongue
- wire groove in the driver is dirty, worn out or broken out: remove driver, see chapter 15, clean wire groove resp. exchange driver

Staple back does not lay tight:

- pressure of the stitching too weak: adjust stitching unit to stitching thickness

Staple legs are not bent enough:

- pressure of the stitching too weak: adjust stitching unit to stitching thickness
- clinchers do not go upwards enough: adjust compression for the clincher lifting at the stitching unit
- timing from clincher actuation to lifting actuation not correct: stitching unit must be adjusted again at the manufacturer

Staple back does not lay tight, is saddle shaped

- pressure of the stitching too weak: adjust stitching unit to stitching thickness
- wire weak or soft
- pressure of the shoe tongue too weak or blocked: remove blocking wire pieces or replace compression spring in the shoe tongue

Staple legs rammed and are not correctly bent:

- wire weak or soft
- wire not straightened: see chapter 8
- clincher box must be aligned: see chapter 6
- staple legs not equal length: see chapter 10
- overall wire length too short: see chapter 9
- round or flat knife worn out: see chapter 13

Wire does not pierce through and builds loops:

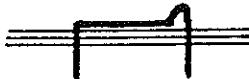

- wire weak or soft
- groove in the bender is clogged by wire pieces
- round or flat knife worn out: see chapter 13
- wire groove in the driver is dirty, worn out or broken out: remove driver, see chapter 15, clean wire groove resp. exchange driver
- shoe tongue spring too weak: remove blocking wire pieces or replace compression spring in the shoe tongue
- clincher box not aligned properly: see chapter 6

Staple legs break off.

- latch not adjusted: see chapter 12

- wire is brittle: use other wire quality
- former is blocked by wire pieces: remove wire pieces, eventually remove former
- latch spring or latch defective
- hook spring in the bender is defective
- wire size does not coincide with the wire bender parts (bender and driver)

Bulge at one staple edge:

- wire weak or soft
- driver is broken out: see chapter 15
- cutting knives are wornout: see chapter 13
- clincher box out of alignment to the head

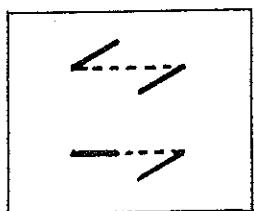

Staple legs run together or apart:

- wire not straightened: see chapter 8
- round or flat knife worn out: see chapter 13

One leg is formed wrong:

- wire not straightened: see chapter 8
- clincher box must be aligned: see chapter 6

One or both legs are formed diagonally:

- wire weak or soft
- wire not straightened: see chapter 8
- round or flat knife worn out: see chapter 13
- clinchers broken out: see chapter 16

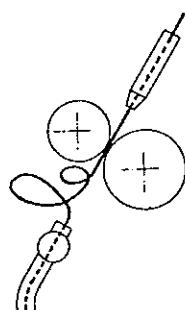

Staple legs are formed diagonally to the same side:

- wire not straightened: see chapter 8

Slightly formed wire pieces:

- wire not straightened: see chapter 8
- adjust bender latch: see chapter 12
- hook spring in the bender is defective

Snarled wire between feed wheels and wire tube:

- wire not straightened: see chapter 8
- cutting pusher is jamming: round knife is pressed against flat knife, see chapter 13b, cutting yoke is blocked, see chapter 4, compression spring in the cutting box is defective
- lower wire tube misplaced or wrongly adjusted: move slightly upwards or downwards
- former wrongly adjusted: see chapter 11
- wire tube is clogged

Troubleshooting - loop stitching

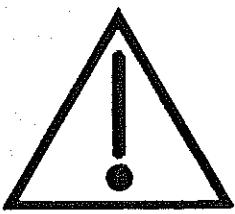

Most faults and specifications of the eventual reasons are indicated in the section before.

Only straight wire pieces appear

- adjust the double spring for the former: see operating manual, part II
- wire not straightened: see chapter 8
- oil the cleansing felt at the wire guiding spring: see chapter 4
- former wrongly adjusted: see chapter 11

ATTENTION

1. Avant de travailler avec la machine, il convient absolument de lire le mode d'emploi Hohner et de respecter toutes les indications se trouvant sur la machine même. Le non-respect de cette recommandation peut entraîner de graves ennuis.
2. Ne pas mettre la machine en marche tous les systèmes de sécurité et de protection aient été mis en place.
3. Couper le courant avant toute réparation et ramener l'interrupteur de sécurité (interrupteur principal) à 0.

Le responsable devra s'assurer de la bonne utilisation de la machine. Le conducteur sera tenu de respecter toutes les prescriptions du mode d'emploi. En cas de problème, s'adresser à la Société HOHNER ou à son représentant.
